

THUNDERFIX

MANUAL

Copyright © Parhelia Tools, 2008

1. What is Thunderfix?

Thunderfix is a small tool that can fix [Mozilla Thunderbird](#) performance. If you have more GB of emails stored in Thunderbird and if you are experiencing slow start time, slow navigation through email folders, you might try Thunderfix.

What Thunderfix does is that it detects *.msf files within your Thunderbird profile and removes them. After that, you can run Thunderbird and wait for new MSF files to be generated and you'll see the improvement. With time MSF files become corrupted and can contain garbage, so this is quick solution for the problem.

2. How to use it?

1. Close Mozilla Thunderbird.
2. Choose your Thunderbird profile you wish to fix (if you have only one profile, in most cases that is "default" profile).
3. Thunderfix will count MSF files and will display the number below the profile name.
4. Click "Fix profile" button.
